

Backend Folder (responsible for managing data connected to my SQL server and receive/send data information to the frontend)

- **Index.js** : main file of the backend. Here I implemented react js app functions that receives/sends data information to each webpage of the frontend
- Package.json and package-lock.js : information about node modules and their dependencies.

Frontend Folder (responsible for the external interface of the localhost website)

- Public folder: not important
- Src:
 - **App.js**: main file for importing each component and display it on the website.
 - **Components** folder
 - addairplane.js: component for staff's adding airplane
 - addairport.js: component for staff adding airport
 - added.js: for displaying added airplanes
 - changestatus.js: for staff changing flight status
 - clienthomepage.js: for client home menu
 - clientlogin.js: for client logging in
 - ...goes on. Each file name corresponds to what it does.

Node_modules folder: contains all the modules that I imported for React App. I did not write this code. These files are automatically written as I installed the modules.
